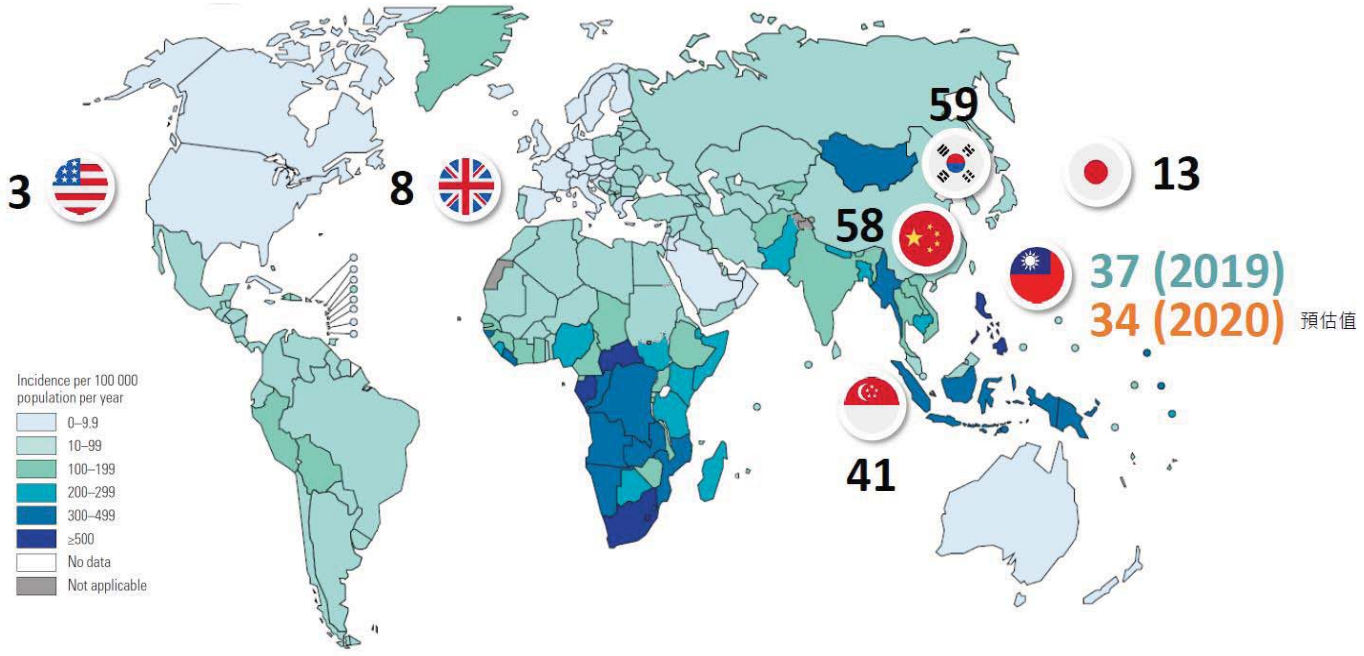
- **Diagnosis of LTBI**
- **Regimen for Latent TB Infection Treatment**

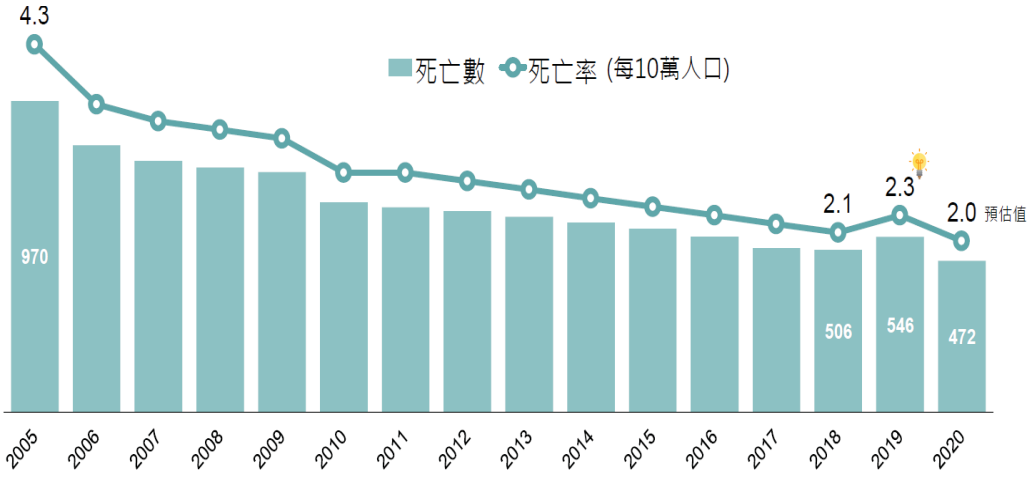
Global incidence of TB in 2019

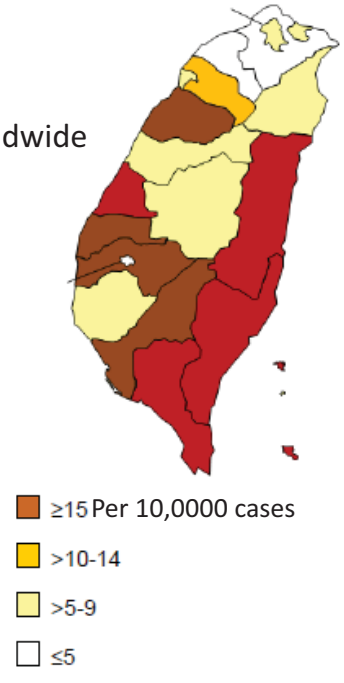


資料來源： WHO Global tuberculosis report 2020

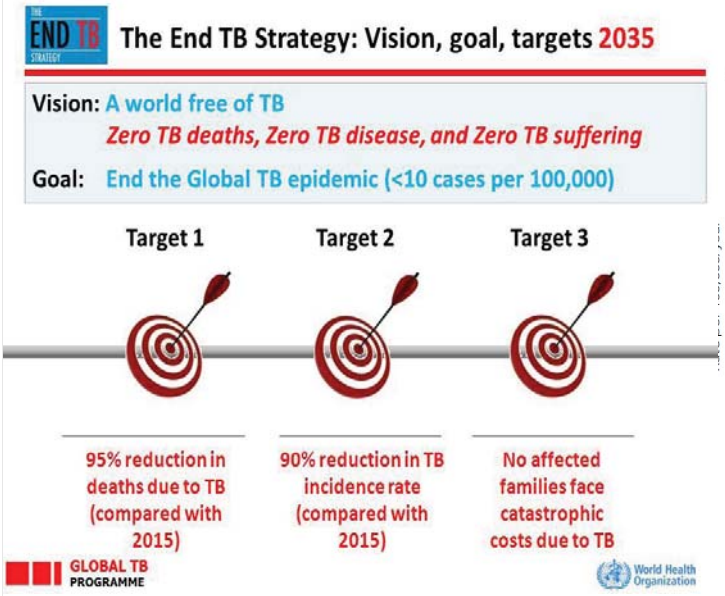
TB related mortality

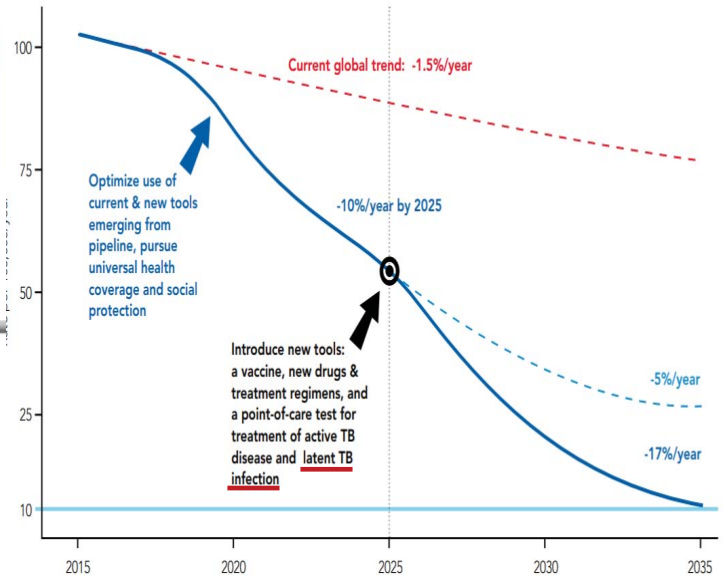
- In 2017, 1.7 million TB deaths were reported
  - Almost infected cases can be cured , but still high mortality rate
  - Innate reactivation rather than re-infection in developing countries
  - The most common opportunistic infection in individuals with HIV worldwide





Projected acceleration in the decline of global TB incidence rates to target levels is important





5

Latent TB Infection

LTBI is a state of persistent immune response to stimulation by MTB antigens without evidence of clinically manifested active, including radiography

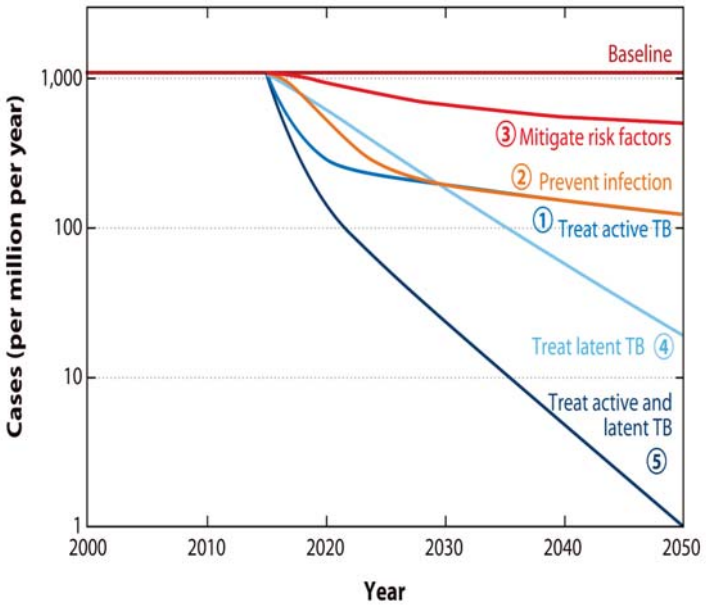
Key for TB Elimination: Treat active TB and LTBI simultaneously

Identify the risk population is essential !



Risk factor for active TB disease	Odds
Close contacts of TB	>20
HIV/AIDS	9.9
Receiving biological agents	7.9
Old TB	5.2
Diabetes mellitus	3.1
Smoker	2.69
End-Stage Renal Disease	2.4
Silicosis	1.7
Gastrectomy	1.4
Low body weight	1.6

US CDC. http://www.cdc.gov/tb/topic/basics/risk.htm

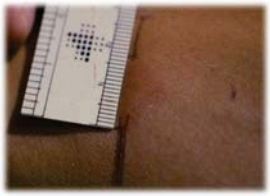
Priority group receiving LTBI diagnosis/treatment by WHO

- First priority:
  - HIV patients,
  - All-aged close contact group
  - Receiving TNF-a treatment patients,
  - Hemodialysis patients
  - Prepare organ/Hematological transplantation patients,
  - Silicolsis pateints
- Second priority: less evidence, but benefit > harms
  - Nursing home/ Hospital workers,
  - Immigrants from high TB endemic area,
  - Nomad,
  - Prism,
  - Drug abuser …etc
- Third priority: lack of evidences, depends on country resourses
  - DM
  - Alcoholism group
  - Underweight population

THE END TB STRATEGY

World Health Organization

Diagnostic Tools for LTBI – Tuberculin Skin Test

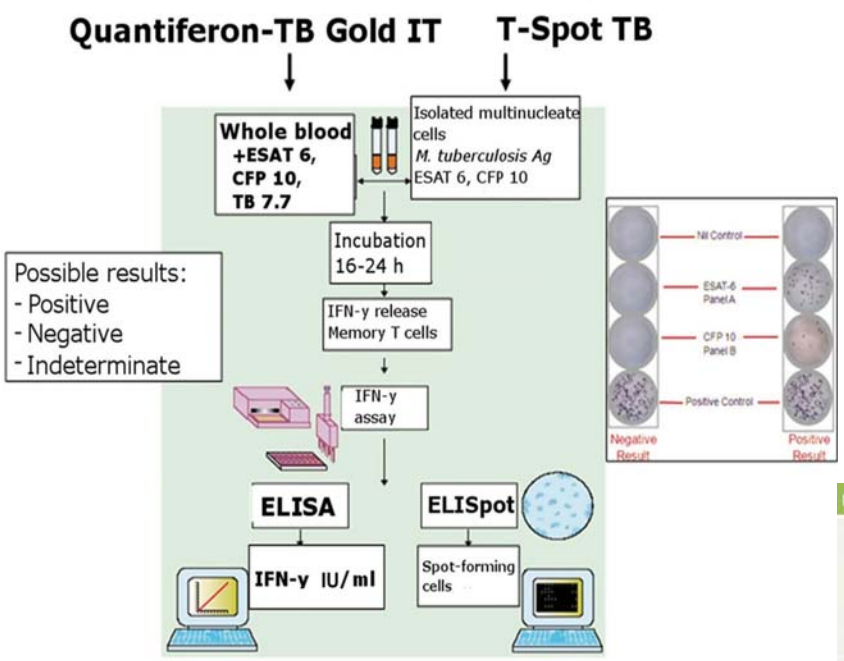


WIKIPEDIA The Free Encyclopedia

Purified protein derivative (**PPD**) is a poorly defined, complex mixture of antigens. Tests based upon PPD are Relatively unspecific since many of its proteins are found In different mycobacterial species

- Post injection 48 – 72 hrs
- **For HIV, malignancy, organ transplantation, under immunosuppresent**
  - Induration ≧5 mm: Positive
- **For health populations**
  - Induration ≧10 mm: Positive
- **Disadvantage:**
  - False negative in immunosuppressant patients
  - Individual skill depends
  - False positive in NTM infection

Diagnostic Tools for LTBI - IGRA-Interferon Gamma Release Assay



- **Advantage**
  - Less false positive in NTM patients
  - Easy test, only one blood test
  - Quantitative
- Use in > 2year-old population

Nil (IU/mL)	TB Ag - Nil (IU/mL)	Mitogen-Nil (IU/mL)	檢驗結果
	≥ 0.35 和≥25%Nil 值	任何	陽性
≤0.8	<0.35 或<25%Nil 值	≥0.5	陰性
	<0.35 或<25%Nil 值	<0.5	不確定 (mitogen<0.5)
>8.0	任何	任何	不確定

Evolution of IGRA test

1st generation QuantiFERON®-TB	2nd generation QuantiFERON®-TB Gold (liquid antigen)	3rd generation QuantiFERON®-TB Gold (QFT® in tube)	4th generation QuantiFERON®-TB Gold Plus (QFT®-Plus)
2001: FDA approval	2004: FDA approval	2007: FDA approval	Q4 2014: CE-IVD 2017: FDA approved
• Measured cell-mediated immunity to tuberculin purified protein derivative (PPD) • **Breakthrough:** TST becomes a blood test	• "Liquid antigen" version • Antigens specific for *M.tb with* 99% specificity • **Clinical benchmark:** No cross reactivity with BCG	• Logistical advantage – remote incubation • **Lab benchmark:** Scalable and easily automated • Explosion of peer reviewed publications >1500	• Addition of patented CD8 antigens – potential biomarker of intracellular TB burden • New flexible blood draw options • High-throughput automation options
			

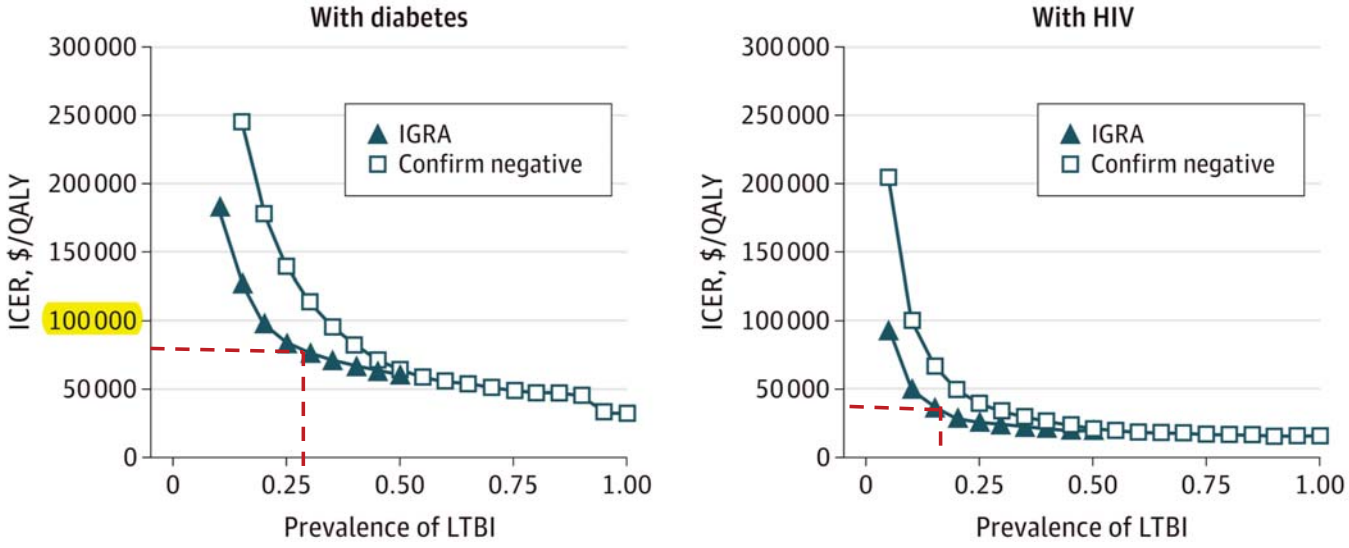
MTB-specific CD8 T cells secrete IFN-γ and other soluble factors to (1–3):

- Suppress MTB growth
- Kill infected cells
- Directly lyse intracellular MTB

- Advantage of 4th generation QFT-plus
  - Higher sensitivity, same specificity
  - Higher positive rates in HIV/AIDS, immunocompromise
  - Potential to minimize indeterminate rate
  - More flexible workflow

Latent Tuberculosis Infection – Taiwan Experience

LTBI盛行率對於治療成本效益的影響



遞增成本效果比值(Incremental cost-effectiveness ratio, ICER)

LTBI prevalence in DM patients

- The prevalence of LTBI in DM patients is more than twice than non-DM group
  - United states: 11.6% vs 4.6%
  - Taiwan: 21.1% vs. 9.7%
- Meta-analysis 13 observational studies, 38263 DM participants
  - Odds ratio for LTBI was 1.18 (95% CI: 1.06-1.30)
  - No correct HbA1c
- The prevalence of LTBI increased with DM severity
  - A cross-sectional study in Atlanta refugee hospital, the prevalence of LTBI
    25.9% in non-DM (median HbA1c: 5.4%)
    39.1% in pre-DM (median HbA1c: 5.8%)
    43.4% in DM (median HbA1c: 7.2%)

Clin Infect Dis. 2017 Mar 15; 64(6): 719–727
Int J Tuberc Lung Dis. 2016 Jan; 20(1): 71–78.

Clinical Infectious Diseases, ciab209, https://doi.org/10.1093/cid/ciab209

- For poorly DM controlled patients (HbA1c >9.0%)
  - Multicenter cohort study in Taiwan 26.7% IGRA (+) in 978 patients with HbA1c >9.0% in previous 1 year
  - Risk factors associated IGRA (+)

Variables	Adjusted OR	95% CI	*P* value

Treatment Regimens for Latent TB Infection

World Health Organization

	Regimen	Dose by weight band
9H	6 or 9 months of daily isoniazid monotherapy (6H, 9H)	Age 10 years & older: 5 mg/kg/day Age <10 years: 10 mg/kg/day (range, 7–15 mg)
4R	Four months of daily rifampicin (4R)	Age 10 years & older: 10 mg/kg/day Age <10 years: 15 mg/kg/day (range, 10–20 mg)
3HR	Three months of daily rifampicin plus isoniazid (3HR)	Isoniazid: Age 10 years & older: 5 mg/kg/day Age <10 years: 10 mg/kg/day (range, 7–15 mg) Rifampicin: Age 10 years & older: 10 mg/kg/day Age <10 years: 15 mg/kg/day (range, 10–20 mg)
3HP	Three months of rifapentine plus isoniazid weekly (12 doses) (3HP)	Age 2–14 years

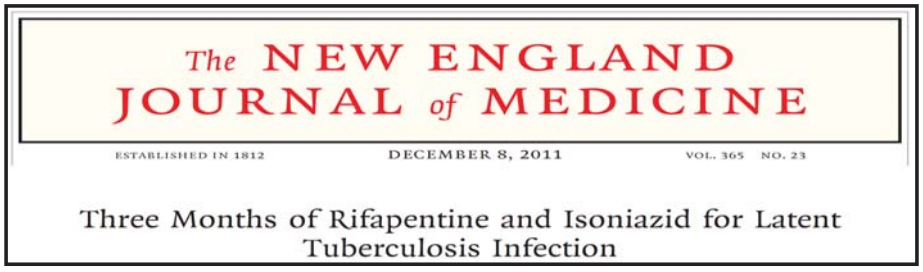
Medicine, formulation	10–15 kg	16–23 kg	24–30 kg	31–34 kg	>34 kg
Isoniazid, 100 mg*	3	5	6	7	7
Rifapentine, 150 mg	2	3	4	5	5

Age >14 years *Medicine, formulation*	30–35 kg	36–45 kg	46–55 kg	56–70 kg	>70 kg
Isoniazid, 300 mg	3	3	3	3	3
Rifapentine, 150 mg	6	6	6	6	6

* 300mg formulation can be used to reduce pill burden

1HP	One month of rifapentine plus isoniazid daily (28 doses) (1HP)	Age ≥13 years (regardless of weight band) Isoniazid, 300 mg/day Rifapentine, 600 mg/day
	Six months of levofloxacin daily (preventive treatment of MDR-TB)	Age >14 years, by body weight: < 46 kg, 750 mg/day; >45 kg, 1g/day Age <15 years (range, approx. 15–20 mg/kg/day), by body weight: 5–9 kg: 150 mg/day; 10–15 kg: 200–300mg/day; 16–23 kg: 300–400mg/day; 24–34 kg: 500–750mg/day

Safety profile in non-HIV population is still lacking



The NEW ENGLAND JOURNAL of MEDICINE

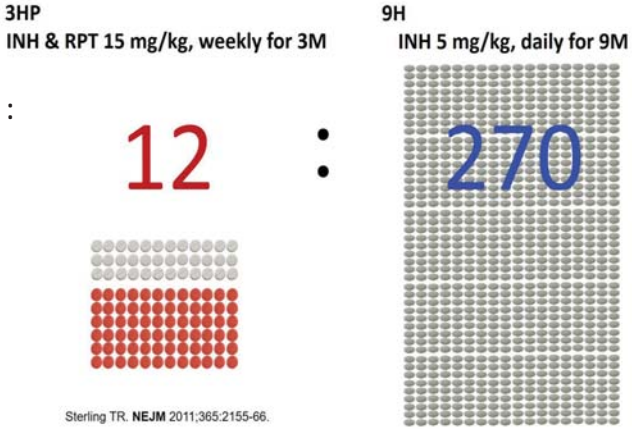
ESTABLISHED IN 1812 DECEMBER 8, 2011 VOL. 365 NO. 23

Three Months of Rifapentine and Isoniazid for Latent Tuberculosis Infection

Prevent Tuberculosis Trial : during 2001-2008, enrolled 8,053 latent TB cases, >12 y/o

- 9H : isoniazid 5 mg/kg x 270 days
- 3HP: rifapentine 15 mg/kg & isoniazid 15 mg/kg
- Modified intent-to-treat & per-protocol analysis : 3HP efficacy is non-inferior to 9H
- **Completion rate**: 3HP > 9H (82% vs. 69%)
- **Discontinue due to adverse effect rate** : 3HP > 9H （7.9% vs. 3.7%，$p = 0.009$）
  - 3HP ADR : SDR, flu-like syndrome
  - 9H ADR : hepatitis

- **3HP was used for > 2 year-old LTBI cases in Taiwan since 2019**



Sterling TR. NEJM 2011;365:2155-66.

SDRs in Prevent Tuberculosis Trial

- Systemic drug reaction accounts for the high termination rate of 3HP
  - Flu-like syndrome
    - Presence of fever, chills, weakness, fatigue or muscle pain, aches, syncope, heart rate >100, palpitations, flushing, dizziness, or sweats
  - Shock, Urticarial, Conjunctivitis, Bronchospasm…etc
- SDR occurred in 2% of total population
  - 3HP: 3.5% vs 9H: 0.4% (p<0.01)
- Median dose prior to event dose: 3rd
- Median time from drug intake to event: 4 hrs (1.0-8.0)
- Median time to resolution: 24 hrs (12-48)

Table 5. Multivariate Logistic Regression of Risk Factors for Systemic Drug Reactions

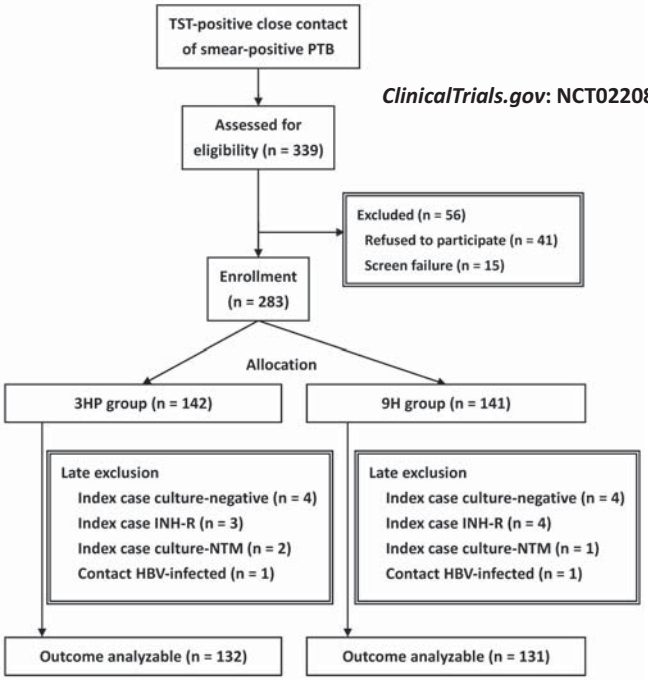
	Adjusted OR	95% CI	*P* Value
3HP vs 9H	9.4	5.5, 16.2	<.001
White-non-Hispanic race	3.3	2.3, 4.7	<.001
Female sex	2.0	1.4, 2.9	<.001
Age ≥35 y (median[a])	2.0	1.4, 2.9	<.001
Body mass index (BMI)			.009
18.5–24.9 (normal)	reference		
<18.5 (underweight)	0.9	.4, 2.2	.88
25–29.9 (overweight)	0.5	.3, .7	.001
≥30 (obese)	0.7	.4, 1.0	.05
Any concomitant non-study drug	1.2	.8, 1.7	.33

Clin Infect Dis. 2015 Aug 15; 61(4): 527–535.

3HP vs. 9H: A pilot study in Taiwan (2014)

- Multicetere, randomize controlled study
- 6 Hospitals
- Study Period: 2014 – 2018
- Primary endpoints: Completion rate
- Secondary endpoints:
  - Active TB within subsequent 2 years

Variables	3HP (n=132)	9H (n=131)
Age, mean ± SD, years	31.7 ± 15.0	32.0 ± 16.4
Men, n (%)	81 (61.4)	71 (54.2)
BMI, mean ± SD	23.3 ± 4.0	22.8 ± 4.1
Current smoking, n (%)	13 (9.8)	16 (12.2)
Household contact, n (%)	66 (50.0)	60 (45.8)



ClinicalTrials.gov: NCT02208427

Sun HY. Tuberculosis 2018;111:121-6.

Conclusions on 3HP vs. 9H in Asian Population

3HP had …..

1. Higher completion rate: 89.4% *vs.* 77.9%
2. Less hepatotoxicity: 1.5% *vs.* 5.4%
3. More Gr.2 non-hepatitis ADR: 12.9% *vs.* 3.8%
4. More flu-like symptoms: 40.9% *vs.* 16.8%
5. Sometimes systemic drug reaction: 3.8%
6. Usually transient and Gr. 1: 69.1%
7. 3HP related SDRs occured more in age ≥ 35, female

Variables, n (%)	Men (n=81)	Women (n=51)
Fatigue	3 (3.7)	2 (3.9)
Dizziness	4 (4.9)	1 (2.0)
Nausea	1 (1.2)	2 (3.9)
Vomiting	3 (3.7)	4 (7.8)
Fever*	1 (1.2)	7 (13.7)
Chills#	1 (1.2)	4 (7.8)
Hot flushes	0 (0)	0 (0)
Headache	2 (2.5)	2 (3.9)
Myalgia	1 (1.2)	2 (3.9)
Cutaneous reaction#	1 (1.2)	4 (7.8)
Diarrhea	0 (0)	1 (2.0)

Sun HY. Tuberculosis 2018;111:121-6.

Extend 3HP use in all-aged and high-risk population: Taiwan-1

- A multicenter prospective observational study
- SARs: ADRs ≥ Grade 2, not including hepatotoxicity

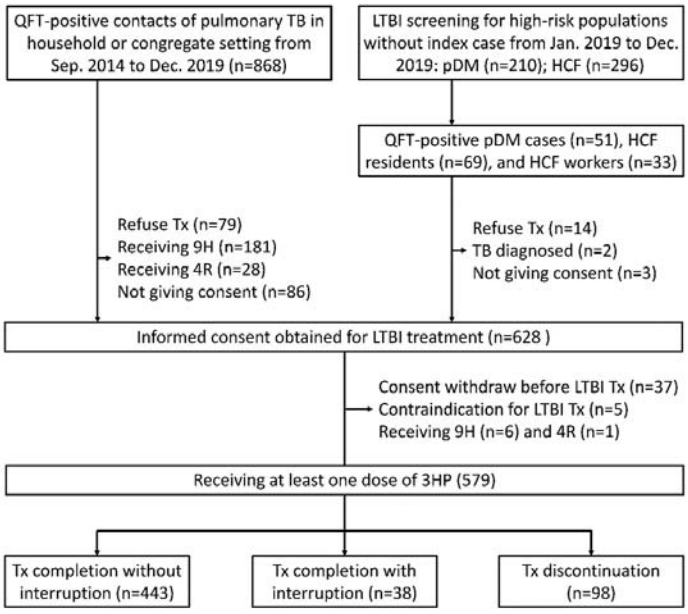
Extend 3HP use in all-aged and high-risk population: Taiwan-2

- A Prospective, multicenter Study
- IGRA positive and receive ≥1 3HP dose under DOT
  - Close contact to pulmonary TB
  - High risk population
    - Long term care facility residents/workers
    - Poorly diabetic controlled patients
- Age stratified:
  - younger group (≤35 years),
  - middle-aged group (35-65 years),
  - elderly group (≥65 years, 23.1%)
- Programmatic ADR follow-up and management
- Endpoint: Treatment completion rate and risk of SDR in different age groups



Clinical Infectious Diseases, ciaa1741

Course and outcome on 3HP treatment in age groups

	Age ≤ 35 (n=165)	Age 35 ~ 65 (n=280)	Age ≥ 65 (n=134)
Complete treatment	156 (94.5%)*	226 (80.7%)	99 (73.9%)
No ADRs	58 (35.2%)	101 (36.1%)	58 (43.3%)
Presence of ADR without Tx interruption	86 (52.1%)*	106 (37.9%)	34 (25.4%)
Presence of ADR with Tx interruption	12 (7.3%)	19 (6.8%)	7 (5.2%)
Permanent discontinuation	9 (5.5%)	54 (19.3%)	35 (26.1%)*
No of doses before discontinuation	4.3 ± 2.3	4.4 ± 2.1	4.2 ± 2.4
Cause of discontinuation			
SDR	4 (2.4%)	27 (9.6%)*	6 (4.5%)
Hepatotoxicity	0 (0%)	12 (4.3%)	6 (4.5%)*
ADRs except SDR/hepatotoxicity	5 (3.0%)	10 (3.6%)	14 (10.4%)*

Other reasons	0 (0%)	1 (0.4%)	2 (1.5%)

- Overall completion rate: 83.1%
- The young-age group had highest completion rate, the elder-age group had the lowest
- SDR accounts for the highest permanent discontinuation rate in middle-age group
- Uncontrolled hypertension accounts for >50% of discontinuation rate among elders

Clinical Infectious Diseases, ciaa1741

Details of 3HP related drug adverse reactions

	Age < 35 (n=165)	Age 35 ~ 65 (n=280)	Age ≥ 65 (n=134)
SDR	8 (4.8%)	48 (17.1%)*	9 (6.7%)
Flu-like syndrome	6 (3.6%)	34 (12.1%)*	7 (5.2%)

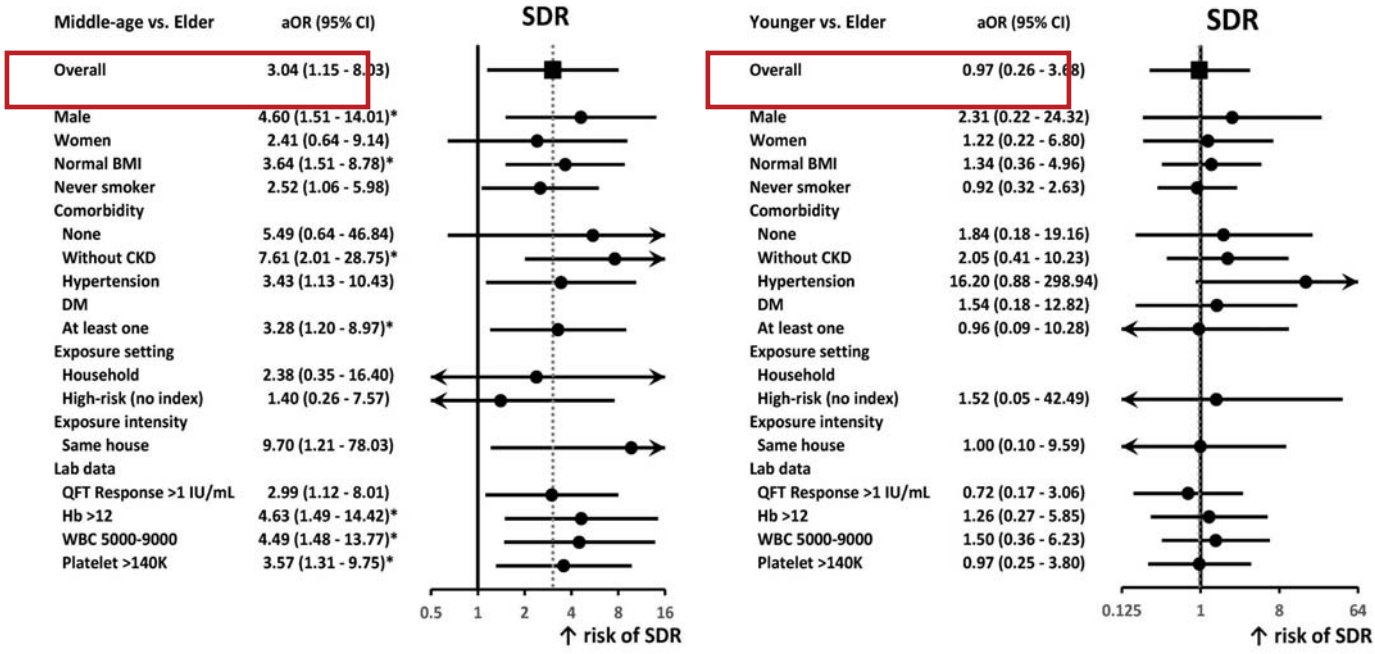
Grade 2	20 (12.1%)	56 (20.0%)	27 (20.1%)
Individual symptom			
Any Flu-like symptoms	60 (36.4%)	135 (48.2%)*	66 (49.3%)
Gastrointestinal disorders	42 (25.5%)	101 (36.1%)	56 (41.8%)
Cutaneous reactions	21 (12.7%)	60 (21.4%)	20 (14.9%)
Hypertension	0 (0%)	7 (2.5%)	15 (11.2%)

- Middle-age group had higher SDR rate, particularly flu-like symptoms than other two age groups
- Elders had higher uncontrolled hypertension rate,
- 86.3% can complete 3HP after temporarily modification of anti-HTN drugs

Clinical Infectious Diseases, ciaa1741

- Compare to elder group, middle-age was significantly associated with increased SDR risk during 3HP even in most clinical settings
- The risk of SDR was not different between the elderly and younger groups



Clinical Infectious Diseases, ciaa1741

3HP is accessible in poorly DM patients under Endocrinist-Pulmonologist-Public multidiscipline corporation

- Prospective, multicenter study. April 2018 to June 2020
  - Taichung Veterans General Hospital
  - Kaohsiung Maniple Ta-Tung Hospital
- **200 cases**
  - Age ≥ 45 years
  - ≥1 time HbA1c ≥9.0% within recent 1 year
- **LTBI screening performed by endocrinologist**
  - Pay-for-Performance project
  - QFT screening
  - Refer to Chest OPD if QFT-positivity
- **LTBI treatment evaluated by pulmonologist**
  - Evaluation
  - LTBI regimen 3HP or 9H: decision sharing strategy
    - Benefit
    - ADR inform and educate

Health Insurance Database Research in Taiwan

- 全國推動3HP治療的上市後蒐集13,427位接受3HP治療的LTBI接觸者的資料顯示
  - 多變項分析: 年齡越大、女性、指標來自非高風險地區，因3HP不良反應導致永久停藥的機會越大。
  - 女性比同齡男性更容易發生因為不良反應而永久停藥的情況
  - 糖尿病、需定血液透析慢性腎衰竭、慢性肝病、使用類固醇等共病接觸者皆較非共病接觸者有更高的風險發生不良反應而永久停藥
  - 藥物間交互作用可能是中高年齡病人完治率較沒有共病者低的主要可能原因。

從 2020 年起，鑒於 3HP 仍有一定比例民眾無法耐受，以及各國及世界衛生組織推薦 3HR 及 4R 處方，故擴大 3HR 及 4R 予全年齡層接觸者使用，增加 LTBI 處方的選擇。

Cost-effectiveness of 3HP compared with other standard treatment regimens : A decision analysis study

Precautions related to 3HP

- **Groups not suitable for use 3HP**
  - 孕婦（目前兩大臨床試驗已證實未對寶寶產生影響，但仍須更大量的經驗累積）
  - INH或RMP抗藥指標個案的接觸者、
  - 未滿2歲之兒童
- 潛伏結核感染者同時服用其他易與**RMP或**RPT產生藥物交互作用之藥物（如：coumadin，methadone，phenytoin…等），亦須評估是否適用
- RMP及RPT皆因為透過活化CYP450酵素的活動，影響其他藥物的體內濃度(通常導致偏低)，若病人併用的藥物療效不足可能危及生命時，要格外謹慎。
  - 使用Proteases inhibitors的感染者會因與RPT交互作用而影響愛滋治療
  - 已有文獻發表使用Efavirenz、Raltegravir或Dolutegravir等抗病毒藥物治療時，雖然仍然與3HP中的RPT有藥物交互作用，但不影響潛伏結核感染治療期間對愛滋病毒抑制的效果

J. Clin. Med. 2019, 8, 812

A new, shorter-course regimen (1HP) is coming

- A randomized, open-label, phase 3, noninferiority trial comparing 1HP and 9H in HIV patients
- **Primary end point:** the first diagnosis of tuberculosis or death from tuberculosis or an unknown cause
- **RESULTS**
  - 3000 patients were enrolled and followed for a median of 3.3 years.
  - 54% were women; the median CD4+ count was 470/mm^3, half received antiretroviral therapy.
  - Primary endpoint: 2% TB occurred in 1HP and 9H group, respectively
  - SAE: 6% of in 1HP group and in 7% of in 9H (P = 0.07).
  - Treatment completion was significantly higher in the 1HP than in 9H group (97% vs. 90%, P<0.001)
- The safety and efficacy report of 1HP in non-HIV group is still lacking

N Engl J Med. 2019 March 14; 380(11): 1001–1011

Comparing Incidence Rate of SDR Under 3HP and 1HP Regimen for LTBI Tx: a Pragmatic Multicenter RCT

***ClinicalTrials.gov*: NCT04094012**

Primary endpoints:

- **Incidence rate of SDR**

Secondary endpoints:

1. ADRs: flu-like symptoms, Hepatotoxicity
2. treatment completion
3. plasma drug levels
4. risk factors of SDR

Number needed: 245 * 2

Study period: 2019 – 2022

First case in: 2019/9/24

The possible mechanism related to 3HP-SDR – RPT

- **Immunologic basis:** Rifampicin-antibody complexes may be associate with "flu-like" reaction
- **Circulating anti-rifampin antibodies (IgM):** not detectable during daily administration, only when receiving intermittent dosing at high dose (> 900mg)
  - Flu-like reaction coincided with peak concentration of rifampin (2-4 hrs) and level of antibody fell during reaction
- Daily administration of rifampin could produce immune tolerance
  - RCT of daily rifapentine followed by intermittent dosing, no reports of flu-like syndrome or hypersensitivity

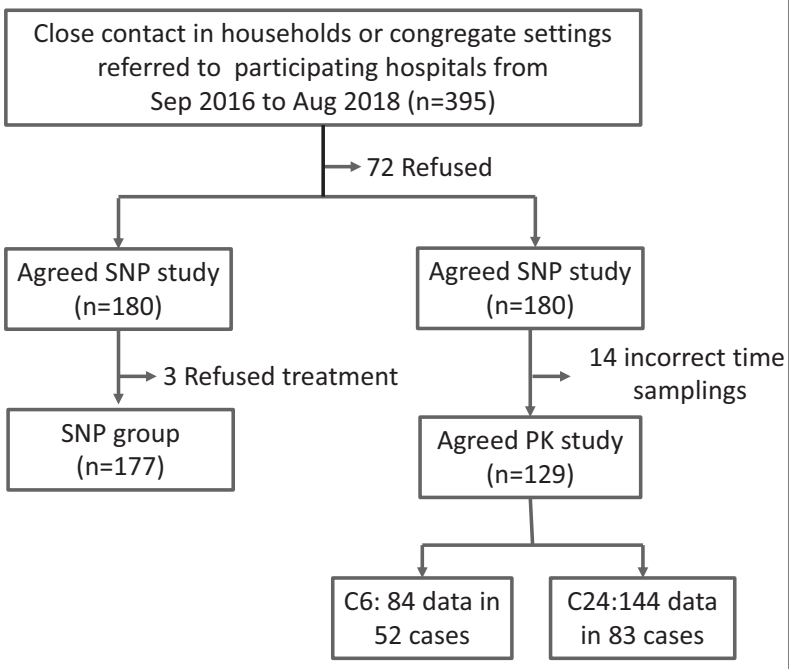
INH maybe related to 3HP-SDR

- INH induced flu-like syndrome also reported
- A prospective multicenter study in Taiwan
  - Pharmacokinetics: C6 and C24
  - Single nucleotide polymorphisms of INH/RPT metabolizing enzyme: NAT2, AADAC, CYP2E1
- Enrolled population:
  - Age ≥ 12 years
  - In close contact with TB patients
  - Diagnosed as LTBI under TST or QFT



J. Clin. Med. 2019, 8, 812

Single neucleotide polymorphism of *NAT2* and *CYP2E1* associated to SDRs

- **177 participants**
- Age: 37.1±17.8
- 6% had underlying comorbidity
- Completion rate: 90%
- SDR: 14 cases, 8%
- SDR occurred more in
  - older age (p=0.038)
  - inferior renal function (p=0.009)
- SDR associated with
  - *NAT2* rs1041983(T): Slow acetylater
  - *CYP2E1* rs2070673 (A)

		Unadjusted OR (95% CI)	Adjusted OR (95% CI)

Adjust with age, sex and estimated glomerular filtration rate * p<0.005

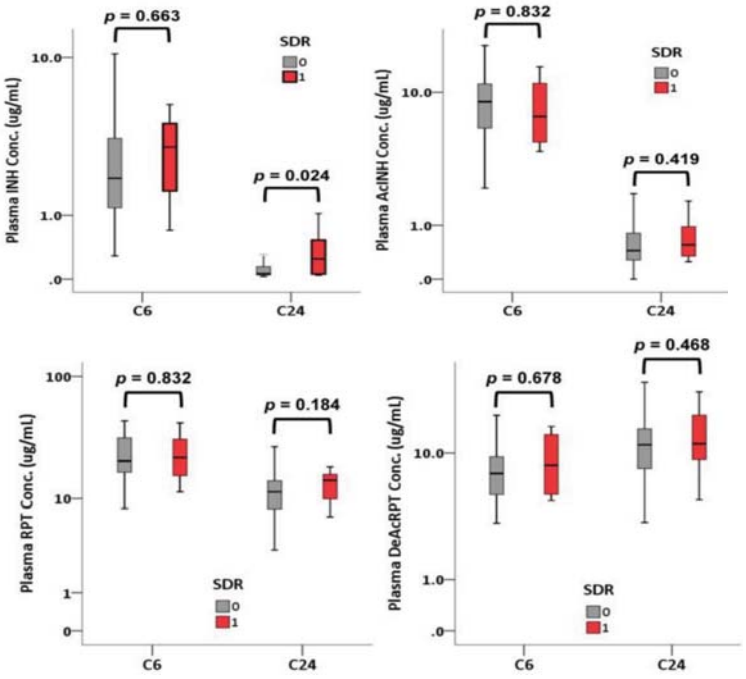
J. Clin. Med. 2019, 8, 812

INH serum concentration associated with SDRs

- 129 participants
- Age: 44.8±17.2
- Completion rate: 83%
- SDR: 13 cases, 10.1%
- C24 INH level was significantly higher in SDR (0.25 [0.06–0.53] vs. 0.06 [0.05–0.15] g/mL, p = 0.024)

Generalized estimating equation (GEE) model:

- C24 plasma INH level was associated with a higher risk of SDR development (OR [95% CI]: 1.61 [1.15–2.25], p = 0.006) but not RPT
- C6: no drug concentration correlated to SDR



J. Clin. Med. 2019, 8, 812

- INH serum concentration rather than RPT plays a role in the development of 3HP-related SDRs
  - Population PK study is essential for further correlation
- NAT2 SNP could be used for risk stratification among TB contacts receiving 3HP regimen
  - Ethnic difference should be considered
  - External validation should be conducted

J. Clin. Med. 2019, 8, 812
